cmmdstack

The skill library every agent in a CMMD repo uses, on Claude Code, Codex and Cursor. Give the agent a goal and a check. It picks the playbook and the skills.

Start every real task here

```
/cmmd-mode Saving a task twice creates two rows. Done when the e2e spec shows one row and a lint blocks the pattern.
```

For work across files, a design choice, or a bug with an unknown cause. It picks a playbook and runs the skills its steps need.

ASK FIRST

/ask-alex

What would Alex do here? Names the flow and the skills, and hands back a prompt to send.

/ask-zack

Is this worth doing now? Checks the work against the strategy in CMMD Brain. Off track stops the work until the owner overrides it.

ON TRACK | DRIFTING | **OFF TRACK**

HARD RULES

1. **Every bug ends in a guard.** Fix it, then **/correct** adds a lint, type check or static check that fails on the bad code, in the same change. A test only when no static check can say it.
2. **Done means proven on the real surface.** The browser, the API, the CLI, an end-to-end run. Green unit tests are not proof.
3. **Review comes from another model.** Never the author, never your own read of your own diff.
4. **Facts come from running something.** A question a check can settle never goes to a human.
5. **AGENTS.md is the one instruction file.** CLAUDE.md is `@AGENTS.md`. The build fails otherwise.
6. **Plain prose. /unslop** on every PR body, doc and comment. No em dashes.

IDEA TO MERGED PR

/debrief
Interview until every decision is settled. Writes CONTEXT.md and ADRs.

/architect
Types and module shape before code that crosses files.

/cmmd-mode
Feature playbook. Test first with **/tdd**.

/interrogate
Multi-model review of the diff. **/council** for three providers.

/file-pr
Then **/babysit-pr** until green and reviewed.

WHEN

Something is broken

- **/cmmd-mode** Bug fix: reproduce, root cause, fix, guard
- **/why** when it used to work
- **/how** to map the subsystem first
- **/fix-ci** for a red pipeline

Lots of similar work

- **/swarm** N workers, one report
- **/arena** race designs, keep the best parts
- **/figure-it-out** big migration, own playbook
- **/research** primary sources, cited note

Walking away

- **/full-stop** runs to merge-ready, never merges
- **/full-send** runs through the merge
- **/show-me-your-work** leaves a decision trail
- **/ketchup** catches you up after

A PROMPT THAT WORKS

State the goal and a check that can pass or fail. Leave out the skill list, because **/cmmd-mode** picks the skills, and a hand-written list drops steps.

WEAK

~~Use tdd and swarm to make the board faster.~~

STRONG

```
Board loads in under 800 ms on the 2k-card fixture. Prove it with the perf spec before and after.
```

Which skill, when

New idea, plan not clear yet	**/debrief**
Not sure it is worth doing	**/ask-zack**
Not sure which skill fits	**/ask-alex**
Bug with an unknown cause	**/cmmd-mode**
Same mistake made twice	**/correct**
Design that crosses files	**/architect**
Contested design or diff	**/interrogate**
Several candidate fixes	**/arena**
Sweep, race, coverage matrix	**/swarm**
How does X work	**/how**
Why was Y built this way	**/why**
Docs or API facts	**/research**
What breaks if I change this	**/blast-radius**
Large migration	**/figure-it-out**
State machine or race	**/statechart**
No UI driver yet	**/create-verification-skill**
Invariant tests miss	**/create-formal-verification-skill**
Report a speedup	**/benchmark-checklist**
Before a commit	**/deslop**
Before review	**/no-comments**
Open a PR	**/file-pr** or **/pr**
Watch a PR to green	**/babysit-pr**
Bot PR comments	**/get-pr-comments**
Merge conflicts	**/fix-merge-conflicts**
Take over a PR	**/takeover**
Old PR, new main	**/modernize**
GPT review loop	**/sol-loop**
PR body or doc	**/unslop**
What did I ship	**/what-did-i-get-done**
Find an old chat	**/recall**

Playbooks inside /cmmd-mode

Name the situation and the mode matches one.

Investigation / Bug fix / Perf issue / Hillclimb / Runtime forensics / Trace forensics / Feature / Refactoring / Prototype / Visual parity / Authoring a skill / Eval / Babysit / Shipping / Autonomous run / Orchestrate / Autopilot / Session pickup / Pause safely / Multi-phase plan / Worktree cleanup / Opening a PR

Principles it cites

Each is its own `principle-*` skill.

Laziness protocol / Subtract before you add / Attack the premise / Model the domain / Boundary discipline / Type system discipline / Make operations idempotent / Prove it works / Fix root causes / Test behavior, not implementation / Explain the number / Build the lever / Guard the context window / Never block on the human / Encode lessons in structure

INSTALL, UPDATE, CHANGE

One library, pinned in every repo.

`node scripts/install-cmmdstack.mjs`
Installs the latest tag into `.agents/skills/` and mirrors it for every tool.

`npm run check:cmmdstack-fresh`
Says whether a newer tag exists. A weekly job opens the update PR for you.

`/plugin marketplace add CMMD-Center/cmmdstack`
Outside CMMD.

Edit a skill in the cmmdstack repo, run `node scripts/check.mjs`, release a tag.

A hand edit to `.agents/skills/` in CMMD fails `check:skills-vendored`.

CMMD-only skills (Sidekick, Forge, migrations) stay unpinned in CMMD.

The rules in `.agents/` win when a skill disagrees.
